

Creating Timber Excellence

Working in partnership with contractors, leading house builders, architects, specifiers and regional developers, Crendon Timber Engineering offers a comprehensive range of products and services from conveniently located design and manufacturing centres.

Crendon constantly strives to create optimum value in timber structures by drawing upon 50 years experience in timber engineering.

Trussed Rafter Packages

Crendon has extensive expertise in the design and fabrication of all types of engineered timber roof structures. The company typically provides the design and supply of trussed rafters as components of the structure, manufactured using MiTek® system with a range of TR26 graded timbers and galvanised steel connector plates.

As part of our installation option on larger projects we undertake an inspection service, ensuring the truss package is constructed and installed correctly and complies with all the relevant British Standards and codes of practice. A handover certificate is then provided to offer the contractor and client full peace of mind.

The company can produce trussed rafters up to a span of 25 metres using the MiTek® system with a full range of TR26 graded timbers and galvanised steel connector plates.

Spandrel and Gable Panels

Crendon is developing an enviable track record in the detailing, off-site manufacture, supply and installation (when required) of Spandrel and Gable Panels.

Designed to match building regulations and the profile of the roof, panels are installed alongside the trusses to form either a gable or dividing wall. By eliminating the need for scaffolding and simplifying the sequencing of other trades in the roof, panels can assist in the reduction of on-site costs.

Joists Packages

Crendon Timber Engineering offers a comprehensive range of engineered wood products for floor and roof applications.

Finnjoists (FJI) - Primarily for use in flooring applications, but also suitable for flat and pitched roofs. I-joist are available in a wide range of widths and depths and lengths up to 14 metres.

Posi-Joist™ engineered floor system - The perfect marriage of stress graded timber and galvanised steel webs to form the world's most popular open web joist. Fully approved to EU Standards. Light, strong and with easily installed services, it offers the user the very best flooring solution.

Site Installation Services

Crendon Timber Engineering employs its own Contracts Managers, who then engage carefully vetted sub-contractors to provide a complete site installation service for all materials and components supplied by ourselves. Health and Safety is a focus at all stages, including crane lifting plans, detailed Health and Safety method statements and full compliance with CDM requirements.

Crendon has a proven methodology from pre-contract meetings, through the on-site programme to completion hand over, to ensure all projects are managed effectively to our customer's satisfaction. This is an increasing element of Crendon Timber Engineering's service offer, as more and more clients value the single point of contact and responsibility this service provides. Whatever the service level you require Crendon Timber Engineering has the skills and resources to match.

Quality and Environmental Credentials

Crendon Timber Engineering is committed to high levels of quality control with ISO 9001 registration. It takes its environmental responsibility seriously, sourcing timber from forests which are certified to either PEFC or SFI standards, with full chain of custody processes.
